**HAT**  
*and Other Clinical Tales*  
"Thoughtful, compassionate, moving... the lucidity and power of a gifted writer."  
— John C. Marshall, *The New York Times Book Review*

## The Man Who Mistook His Wife for a Hat : And Other Clinical Tales by Oliver W. Sacks

In his most extraordinary book, "one of the great clinical writers of the 20th century" ([The New York Times](#)) recounts the case histories of patients lost in the bizarre, apparently inescapable world of neurological disorders. Oliver Sacks's *The Man Who Mistook His Wife for a Hat* tells the stories of individuals afflicted with fantastic perceptual and intellectual aberrations: patients who have lost their memories and with whom it is difficult to communicate; patients who cannot recognize people and common objects; patients who shout involuntary obscenities; patients who are retarded yet are gifted with undiminished intelligence.

If inconceivably strange, these brilliant tales remain, in the end, studies of life struggling against incredible adversity. They are studies of life, impaired, to imagine with our hearts what it must be to live with a neurological disorder. It is medicine's ultimate responsibility: "the suffering, afflicted person."

# Semantic Web: a vision

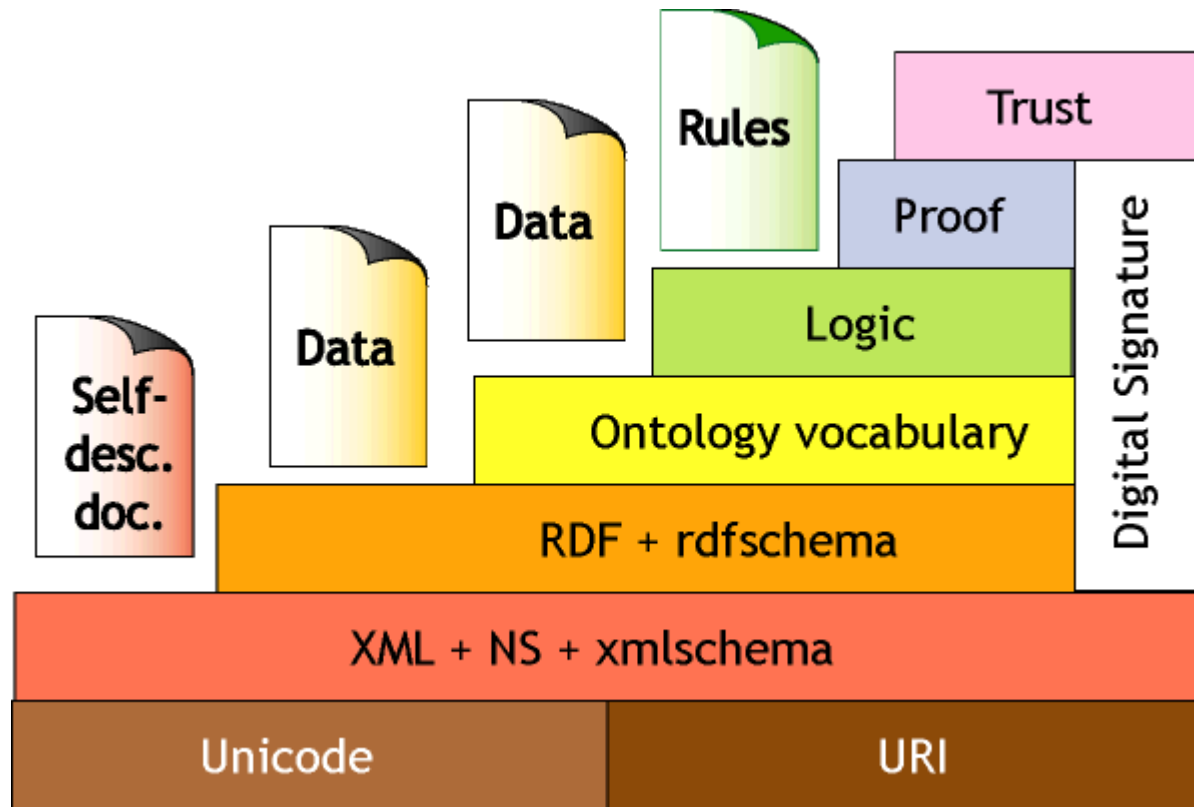

- Tim Berners-Lee (2001)
  - “The Semantic Web is an extension of the current web in which information is given well-defined meaning, better enabling computers and people to work in cooperation.”
- W3C (world wide web consortium)
  - The Semantic Web is a vision: the idea of having data on the Web defined and linked in a way that it can be used by machines not just for display purposes, but for automation, integration and reuse of data across various applications”  
(<http://www.w3.org/sw/>)

# The Semantic Web

- the next generation of the WWW
- information has machine-processable and machine-understandable semantics
- not a separate Web but an augmentation of the current one
- Ontologies as basic building block

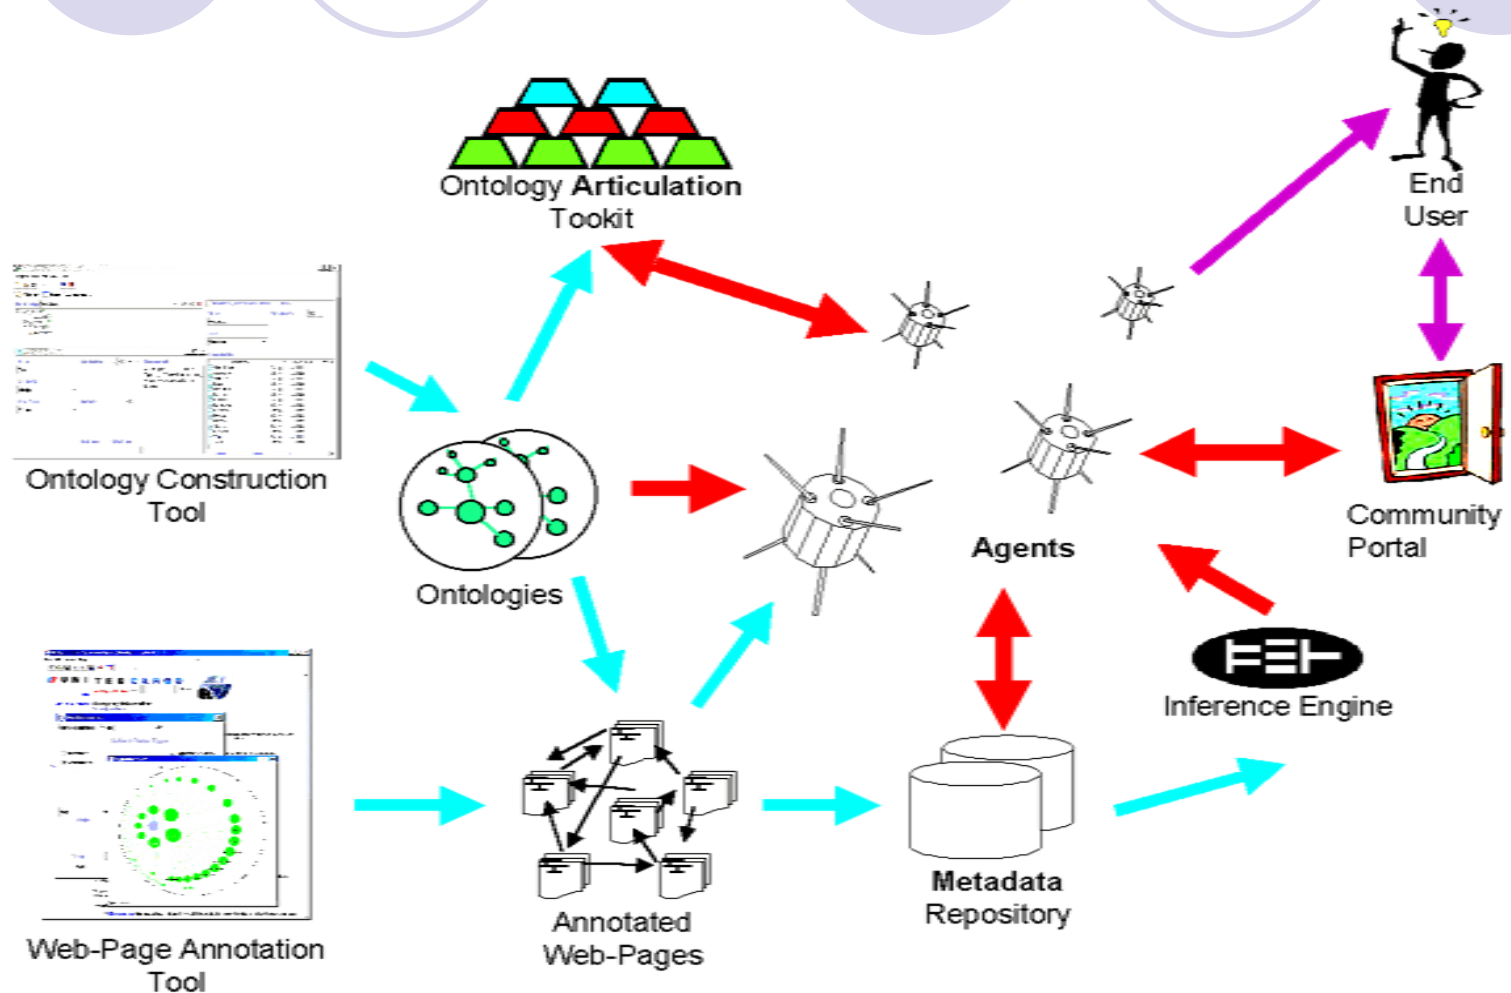

# Semantic Web Layer architecture

# Semantic Web panorama

# Ontology: Why ?

- Problem of communication between people.
- Example: 1 word pipe – 3 notions

A short narrow tube with a small container at one end, used for smoking eg. tobacco.

A long tube made of metal or plastic that is used to carry water or oil or gas.

A temporary section of computer memory that can link two different computer processes.

# Ontology

- „People can't **share knowledge** if they do not speak a **common language**.“  
[Davenport & Prusak, 1998]
- Ontologies enable a **better communication** between Humans/Machines
- Ontologies **standardize** and **formalize** the meaning of words through concepts

# Ontology: benefit

{ Communication between people

{ Interoperability between software agents

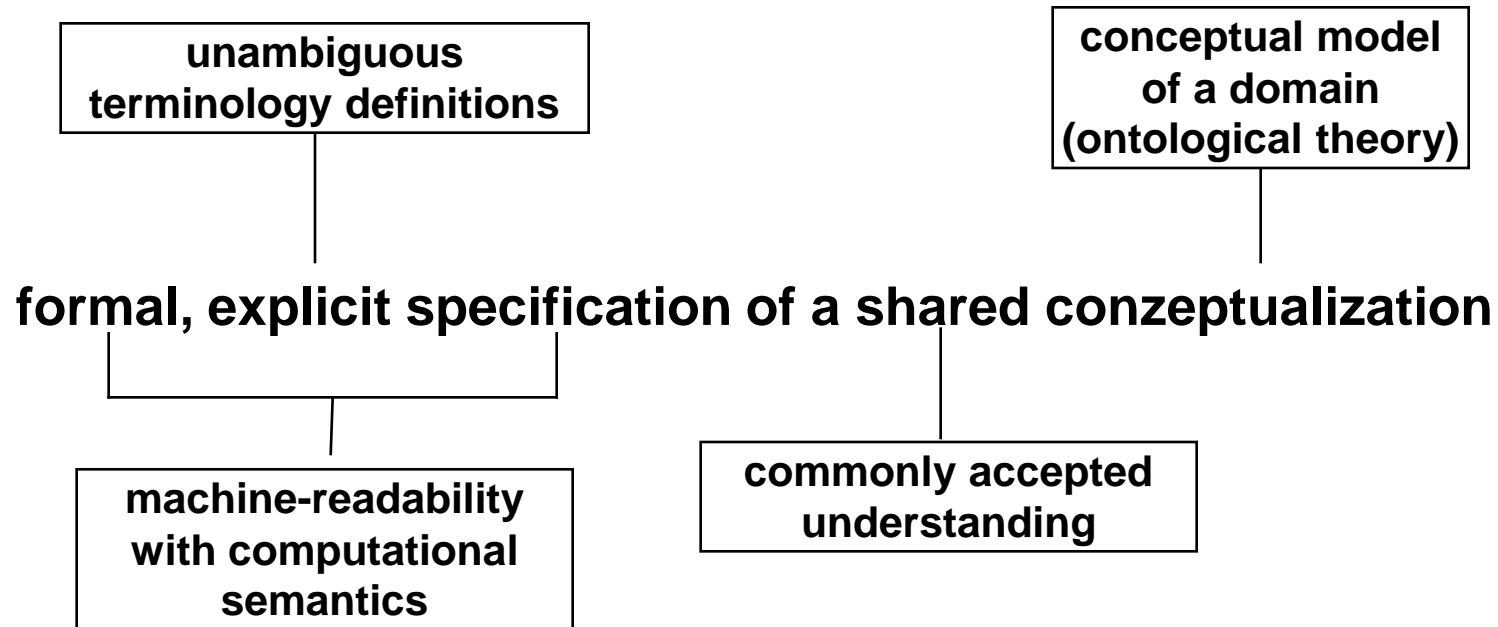

{ Reuse of domain knowledge

{ Make domain knowledge explicit

{ Analyze domain knowledge

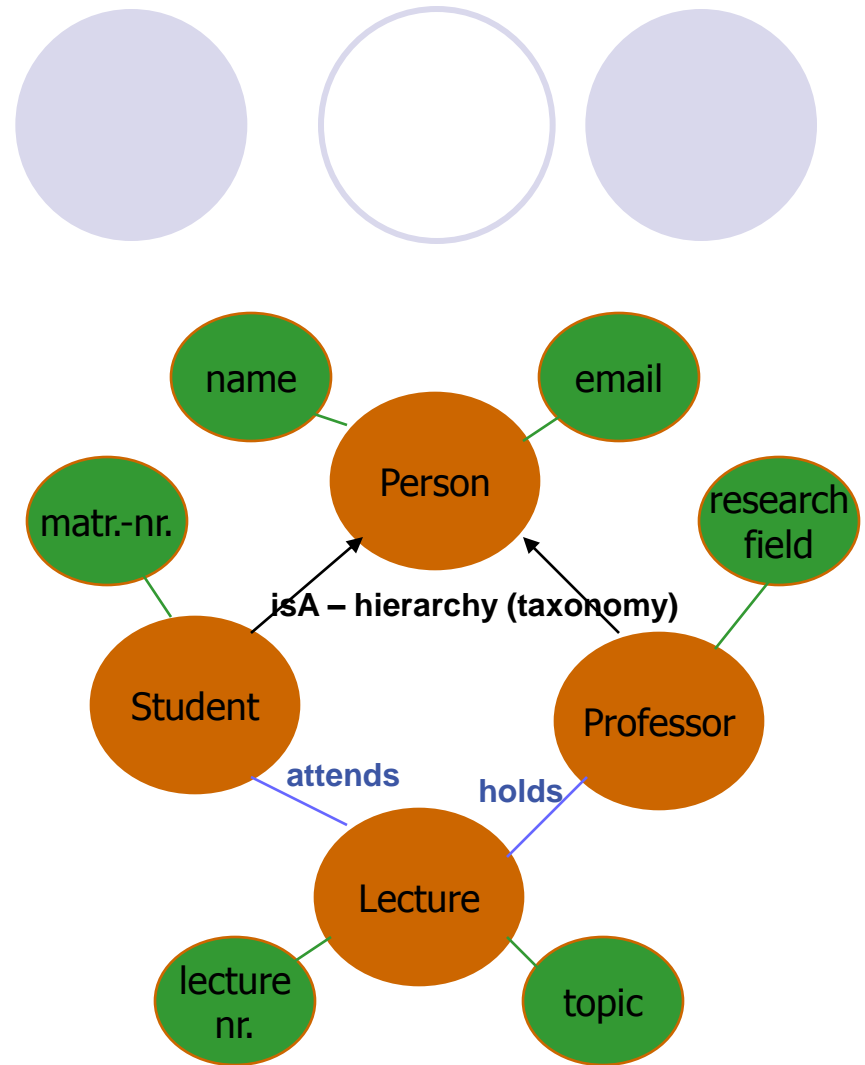

**Knowledge sharing and reuse**

# Ontology Definition

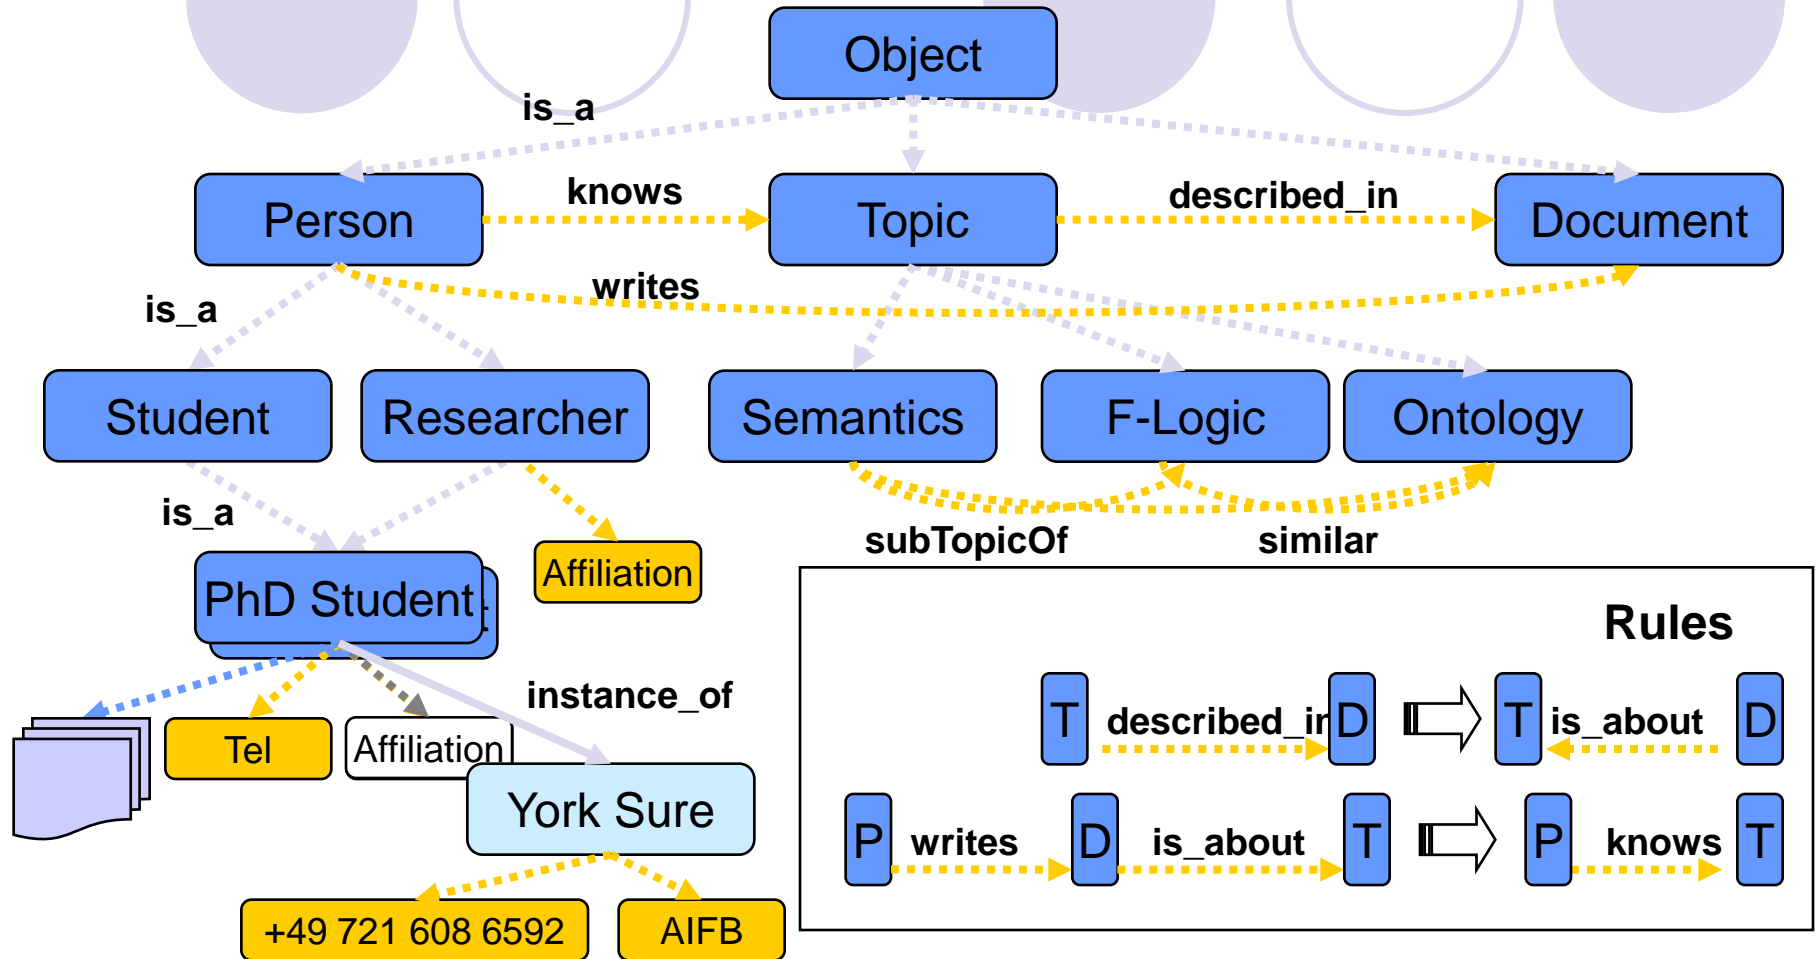

# Ontology Elements

- Concepts (classes) + their hierarchy
- Properties (slots, attributes)
- Property restriction (type, domain, cardinality)
- Relation between concepts
- Instance

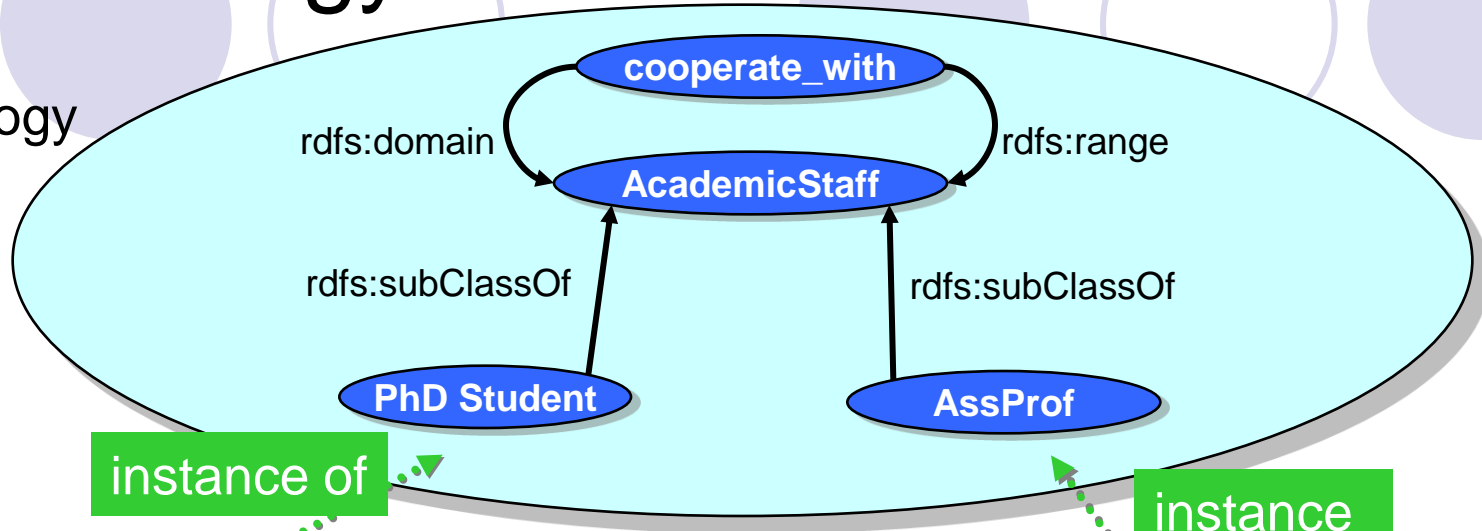

# Ontology (in our sense)

- Representation Language: Predicate Logic (F-Logic)
- Standards: RDF(S); coming up standard: OWL

# Ontology & Metadata

# Another illustration

**Query 1:** get all documents from location X, but not web-pages

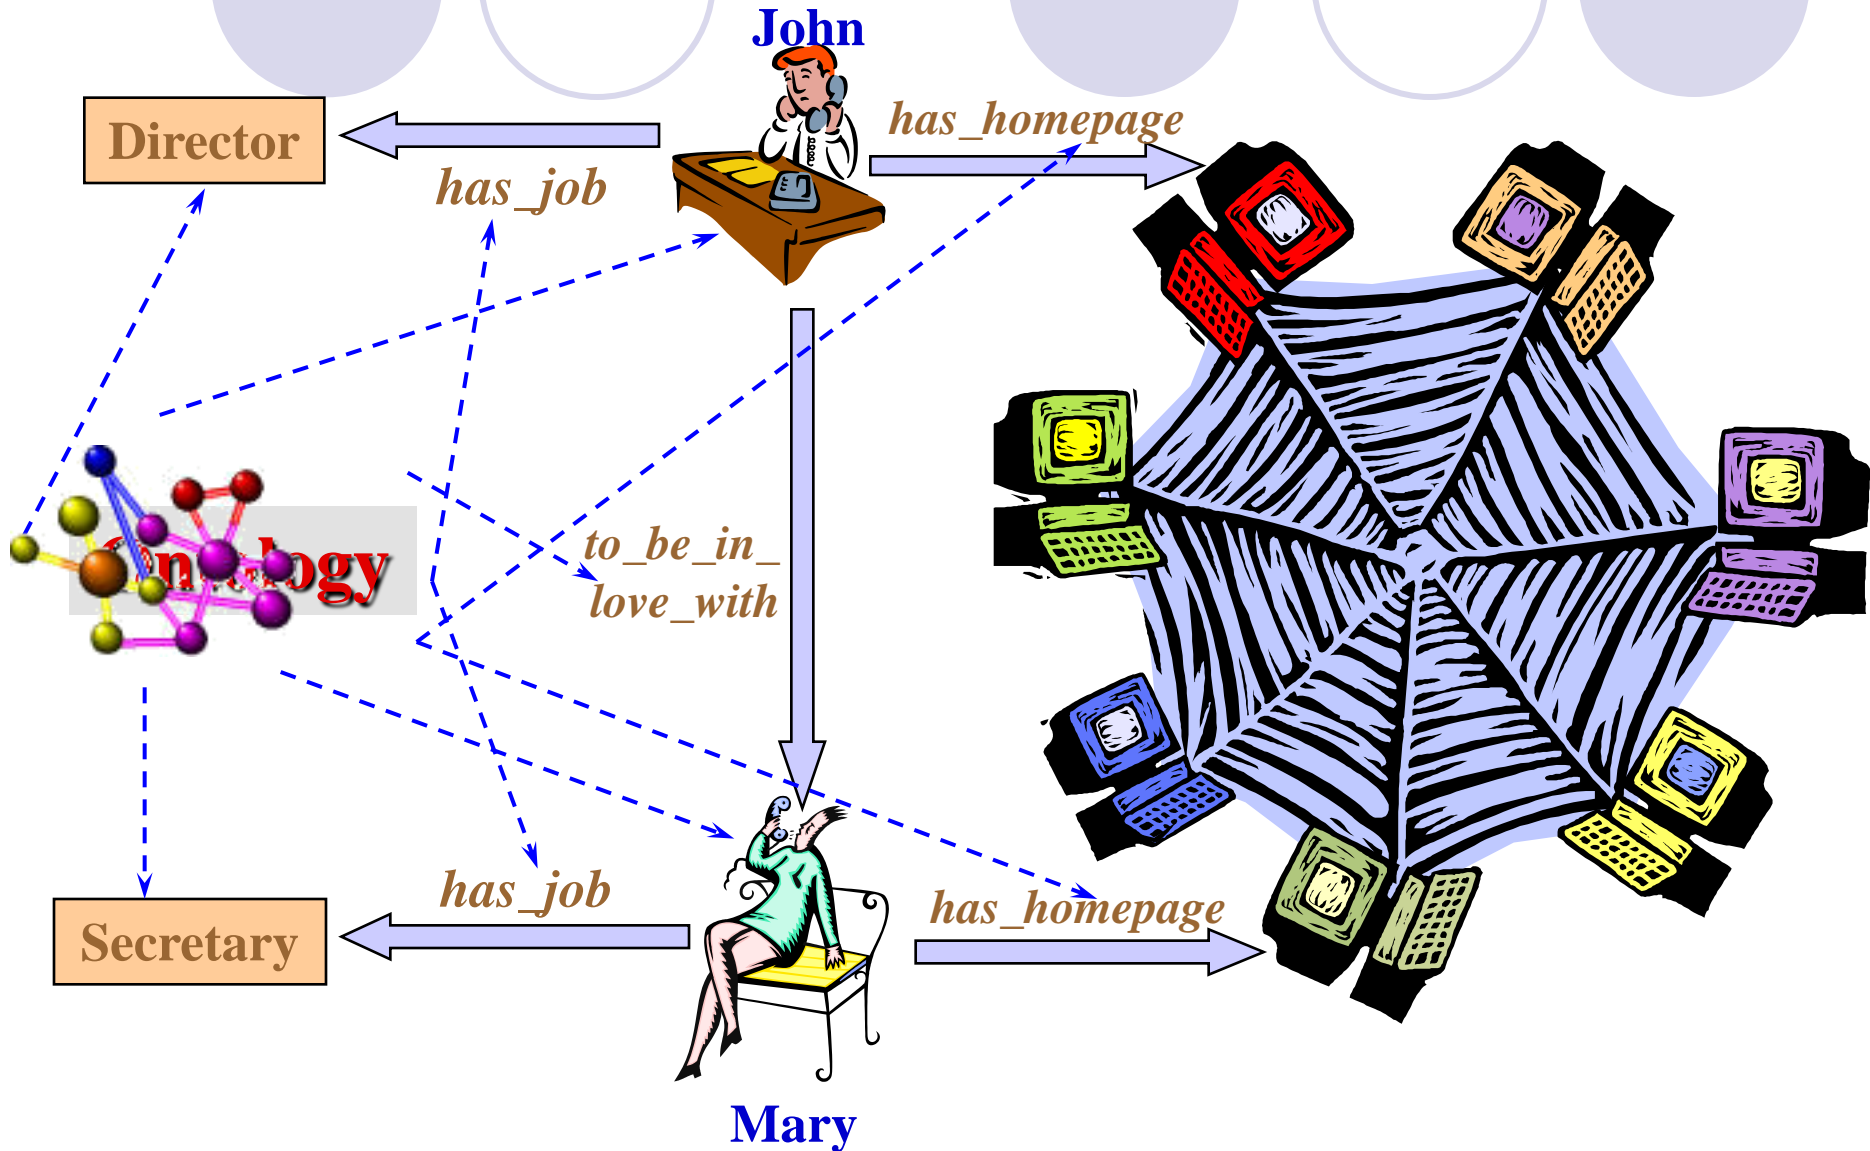

**Query 2:** get documents related to Y, with more then one author, one of which is Terziyan

**Query 3:** are there web-pages of Z with "private" access related to documents with subject S?

# RDF and RDFS (RDF Schema)

- **RDF (Resource Description Framework):**
  - is a W3C standard, which provides tool to describe Web resources
  - provides interoperability between applications that exchange machine-understandable information
- **RDF Schema:**
  - is a W3C standard which defines vocabulary for RDF
  - organizes this vocabulary in a typed hierarchy
  - capable to explicitly declare semantic relations between vocabulary terms

# RDF : annotate Web resource

# RDF statement

- **Subject** of an RDF statement is a resource
- **Predicate** of an RDF statement is a property of a resource
- **Object** of an RDF statement is the value of a property of a resource

*Ora Lassila is the creator of the resource <http://www.w3.org/Home/Lassila>.*

```
<rdf:RDF>
  <rdf:Description about=
    "http://www.w3.org/Home/Lassila">
    <s:Creator>Ora Lassila</s:Creator>
  </rdf:Description>
</rdf:RDF>
```

# An annotation in RDF

```
<INRIA:Document rdf:about="http://www-sop.inria.fr/aar.doc">  
<INRIA:Title>Annual activity report of ACACIA</INRIA:Title>  
<INRIA:Author>  
  <INRIA:Person rdf:about="http://www.inria.fr/~rdieng/" />  
</INRIA:Author>  
</INRIA:Document>
```

## ● Signification:

# RDF Schema syntax in XML

```
<rdf:Description ID="MotorVehicle">  
  <rdf:type resource="http://www.w3.org/...#Class"/>  
  <rdfs:subClassOf rdf:resource="http://www.w3.org/...#Resource"/>  
</rdf:Description>
```

```
<rdf:Description ID="Truck">  
  <rdf:type resource="http://www.w3.org/...#Class"/>  
  <rdfs:subClassOf rdf:resource="#MotorVehicle"/>  
</rdf:Description>
```

```
<rdf:Description ID="registeredTo">  
  <rdf:type resource="http://www.w3.org/...#Property"/>  
  <rdfs:domain rdf:resource="#MotorVehicle"/>  
  <rdfs:range rdf:resource="#Person"/>  
</rdf:Description>
```

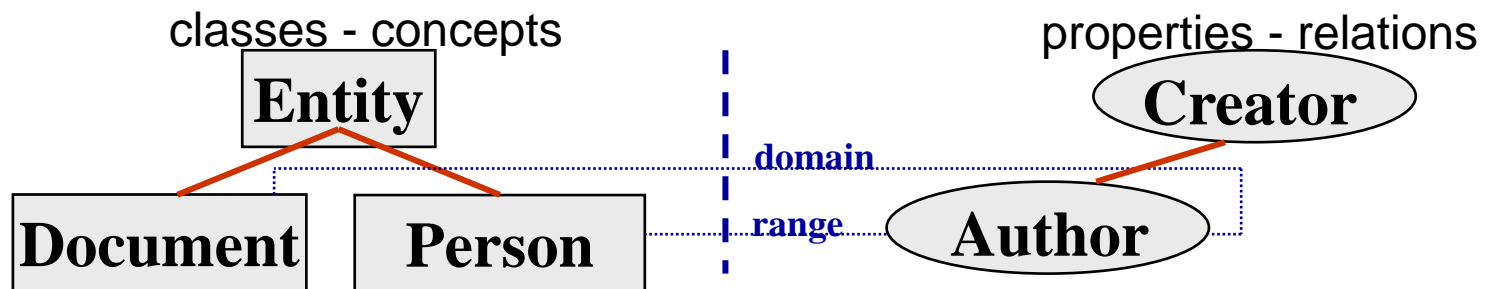

```
<rdf:Description ID="ownedBy">  
  <rdf:type resource="http://www.w3.org/...#Property"/>  
  <rdfs:subPropertyOf rdf:resource="#registeredTo"/>  
</rdf:Description>
```

# language for

- [illegible]

```
<rdafs:Class rdf:ID='Entity' />
<rdafs:Class rdf:ID='Document'>
  <rdafs:subClassOf rdf:resource='#Entity' />
</rdafs:Class>    ...
<rdf:Property rdf:ID='Author'>
  <rdafs:subPropertyOf rdf:resource='#Creator' />
  <rdafs:domain rdf:resource='#Document' />
  <rdafs:range rdf:resource='#Person' />
</rdf:Property>    ...
```

### Signification:

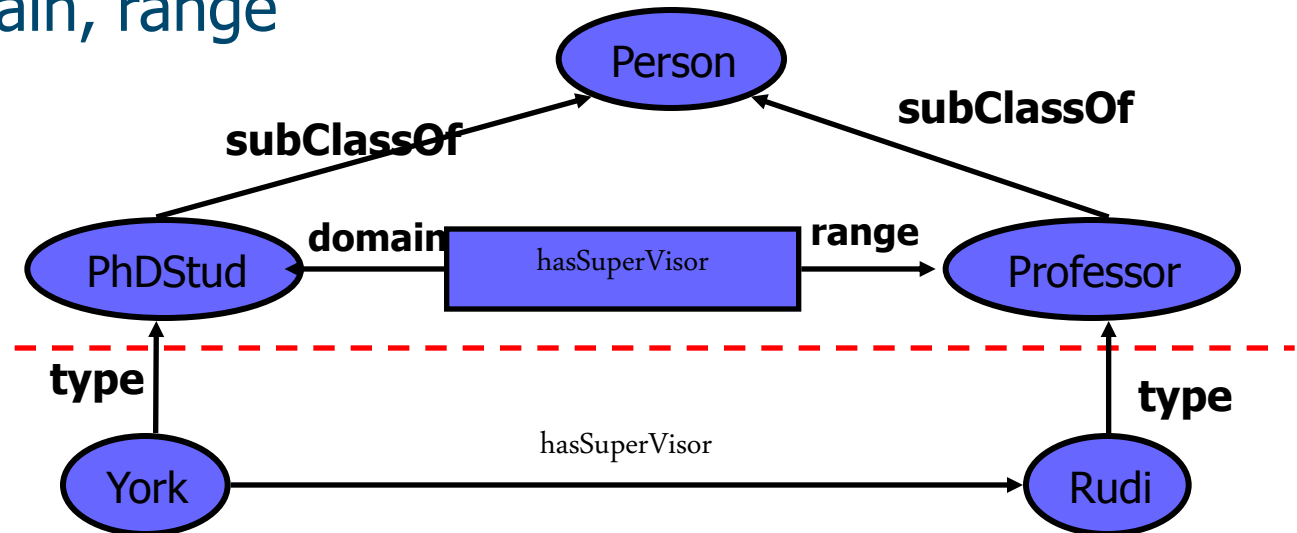

# Semantic Web Application

- Knowledge management
- Enterprise Application Integration
- eCommerce

# What does RDF Schema add?

- Defines **vocabulary** for RDF
- Organizes this vocabulary in a **typed hierarchy**
  - Class, subClassOf, type
  - Property, subPropertyOf
  - domain, range

# Semantic Query

**What is Al Qaeda?**

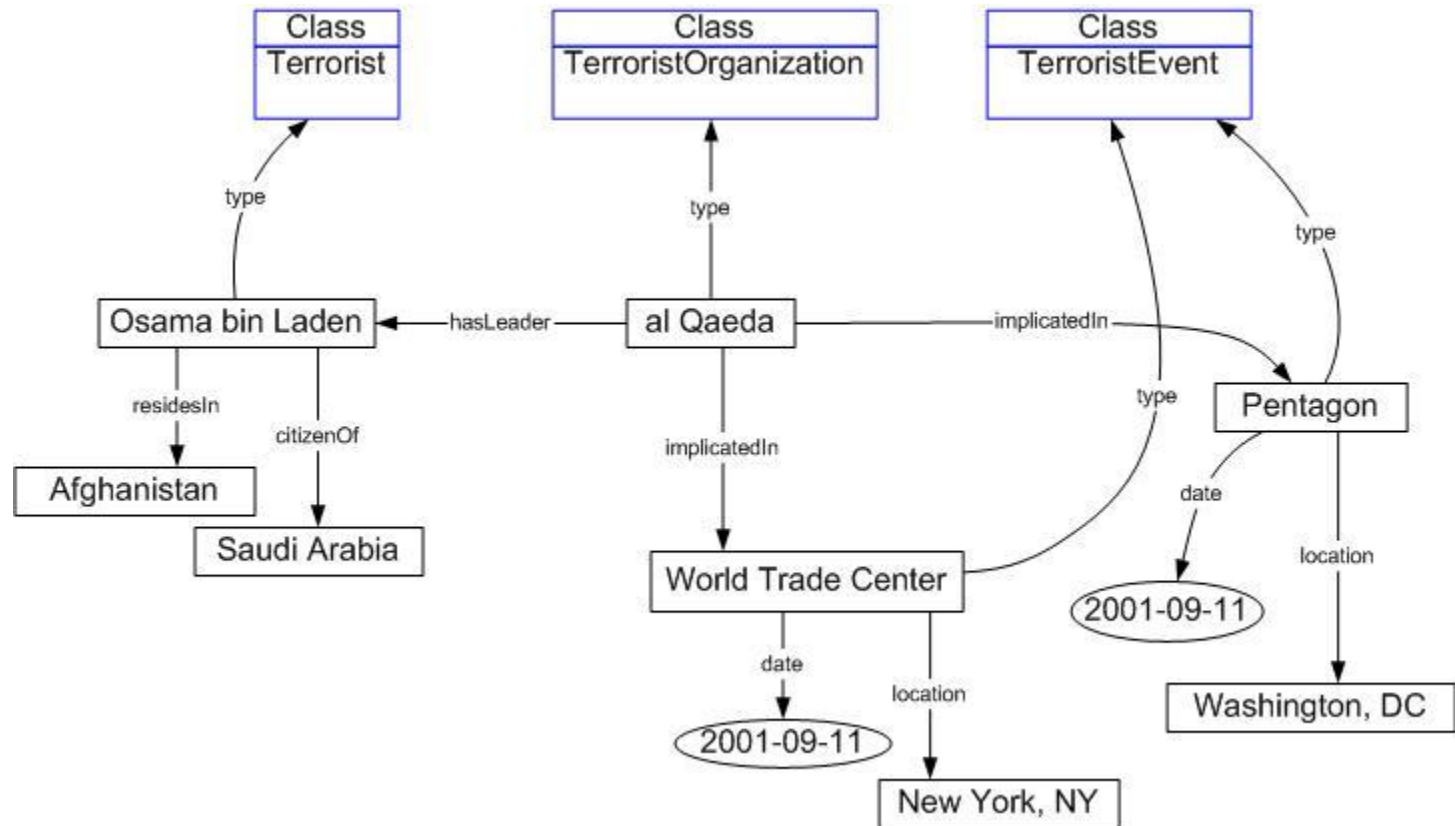

**A terrorist organization**

**Would you like additional information on?**

- ☐ **Membership**
- ☐ **Locations**
- ☐ **Structure**
- ☐ **Finances**
- ☐ **Tactics**
- ☐ **Other terrorist organizations**

# Example Ontology

# How to build an ontology?

- **Steps:**

- determine domain and scope
- enumerate important terms
- define classes and class hierarchies
- define slots
- define slot restrictions (cardinality, value-type)

# Step 1: Determine Domain and Scope

**Domain:** geography

**Application:** route planning agent

## **Possible questions:**

Distance between two cities?

What sort of connections exist between two cities?

In which country is a city?

How many borders are crossed?

# Step 2: Enumerate Important Terms

city

capital

Connection\_on\_land

border

country

road

railway

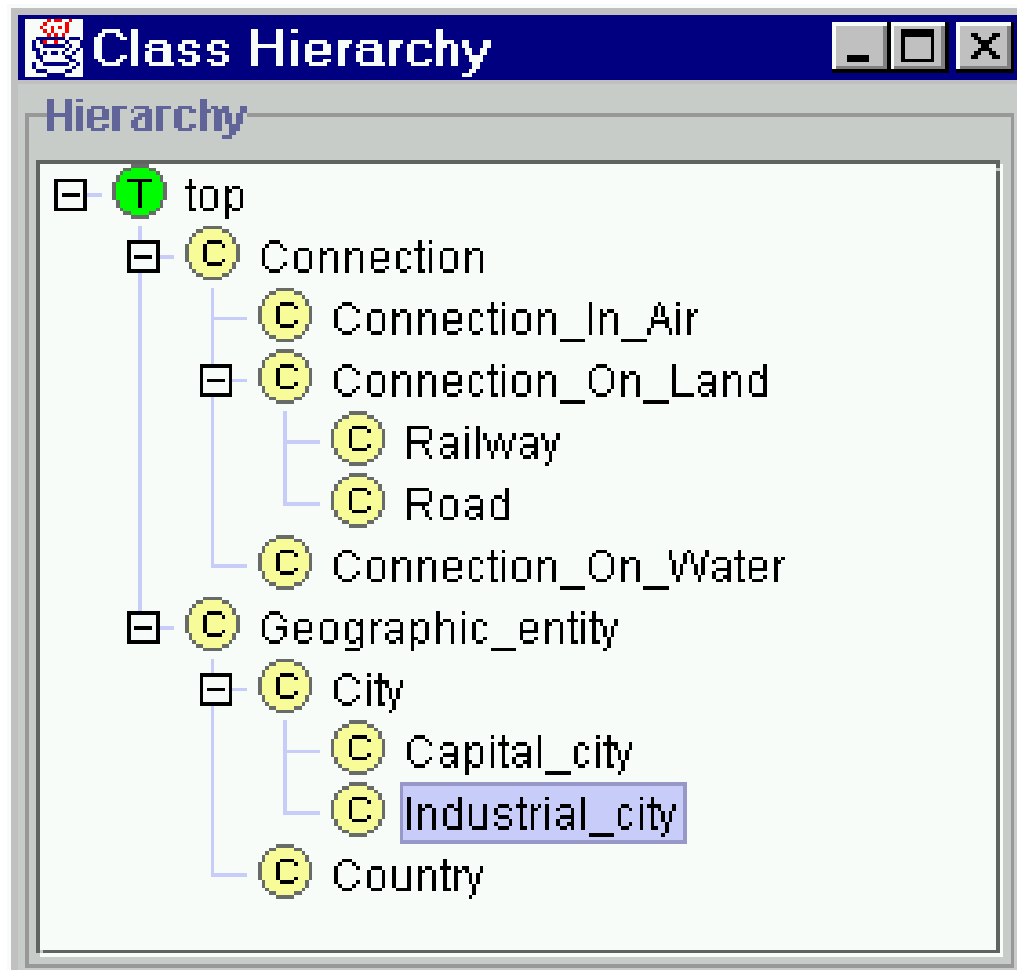

Connection\_on\_water

currency

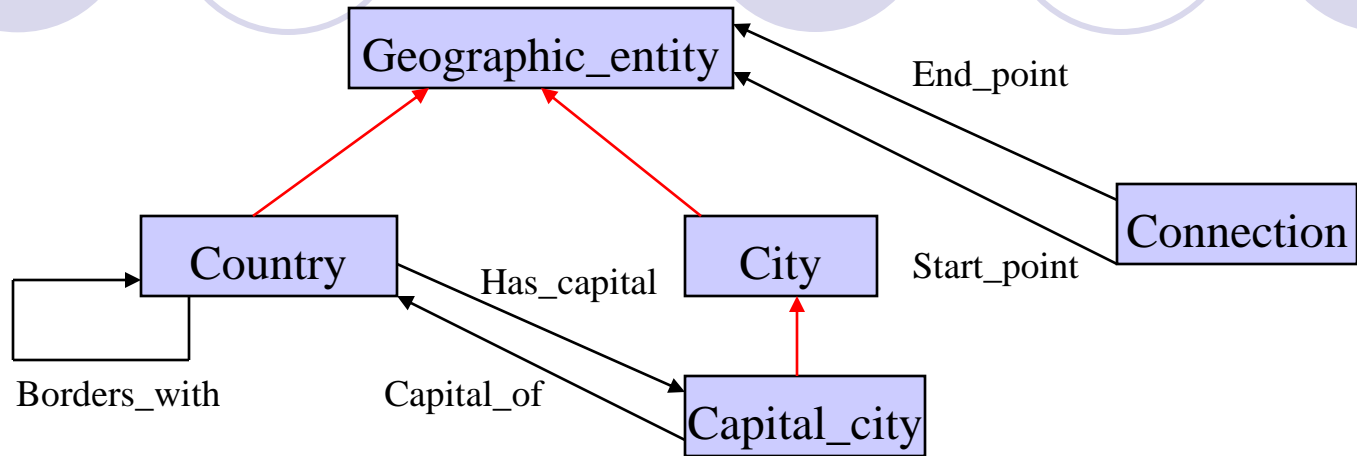

Connection\_in\_air

connection

# Step 3: Define Classes and Class Hierarchy

# Step 4: Define Slots of Classes

## Step 5: Define slot constraints

- Slot-cardinality

*Ex: Borders\_with multiple, Start\_point single*

- Slot-value type

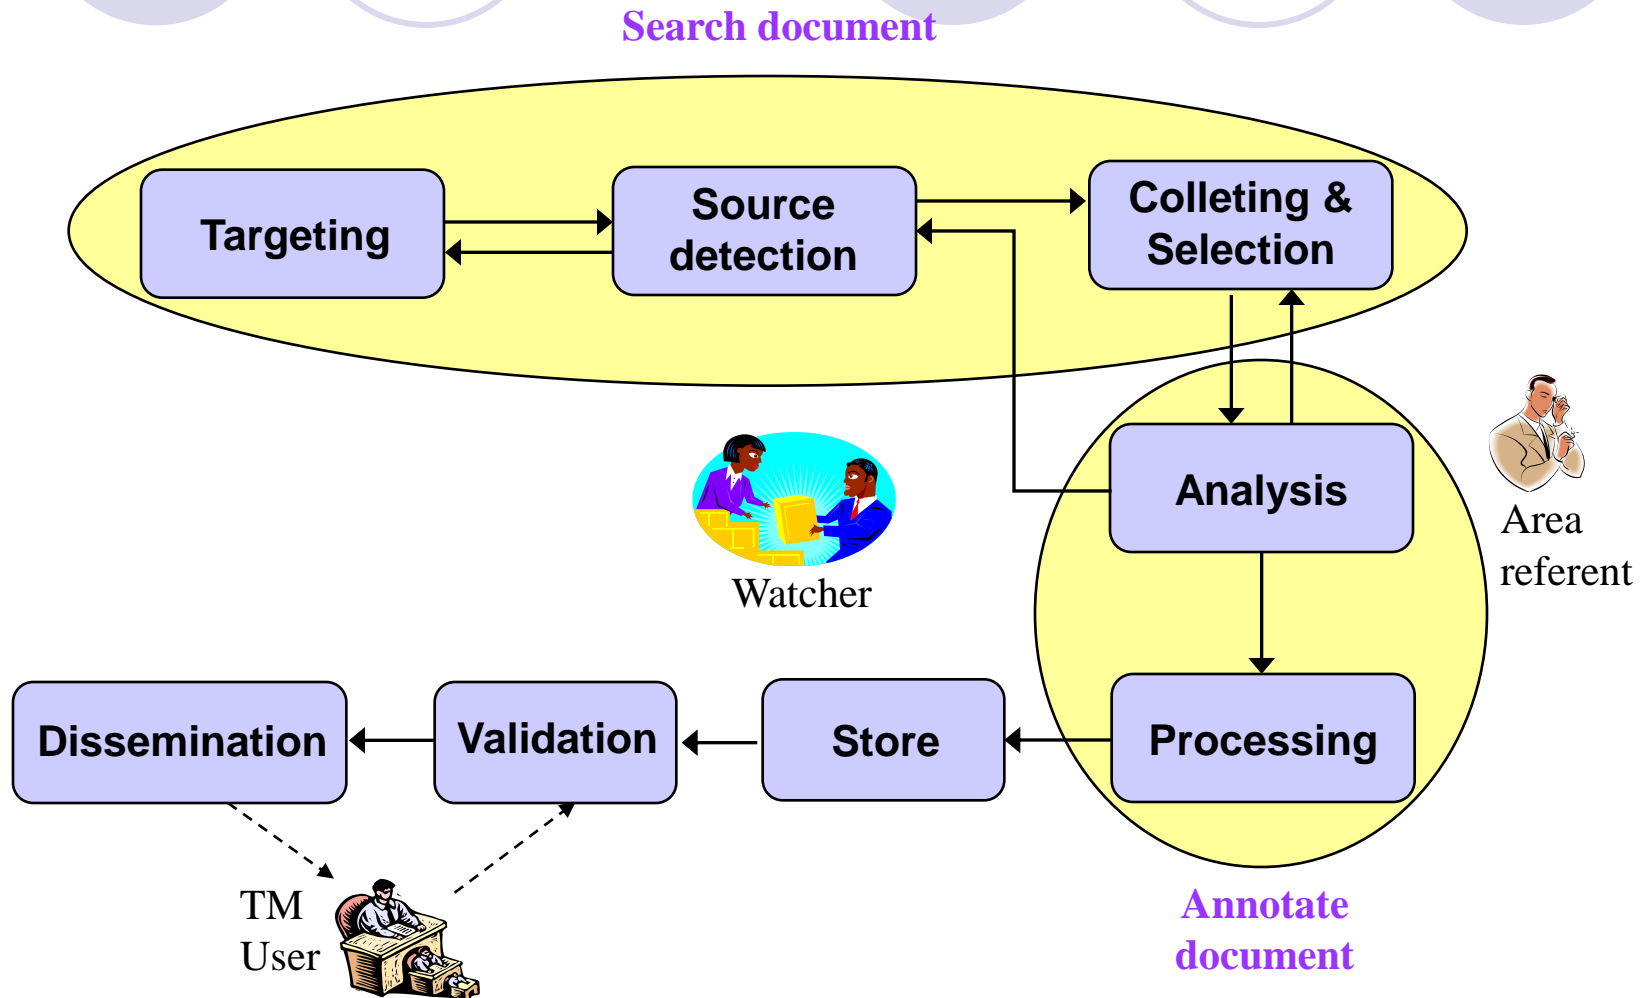

*Ex: Borders\_with- Country*

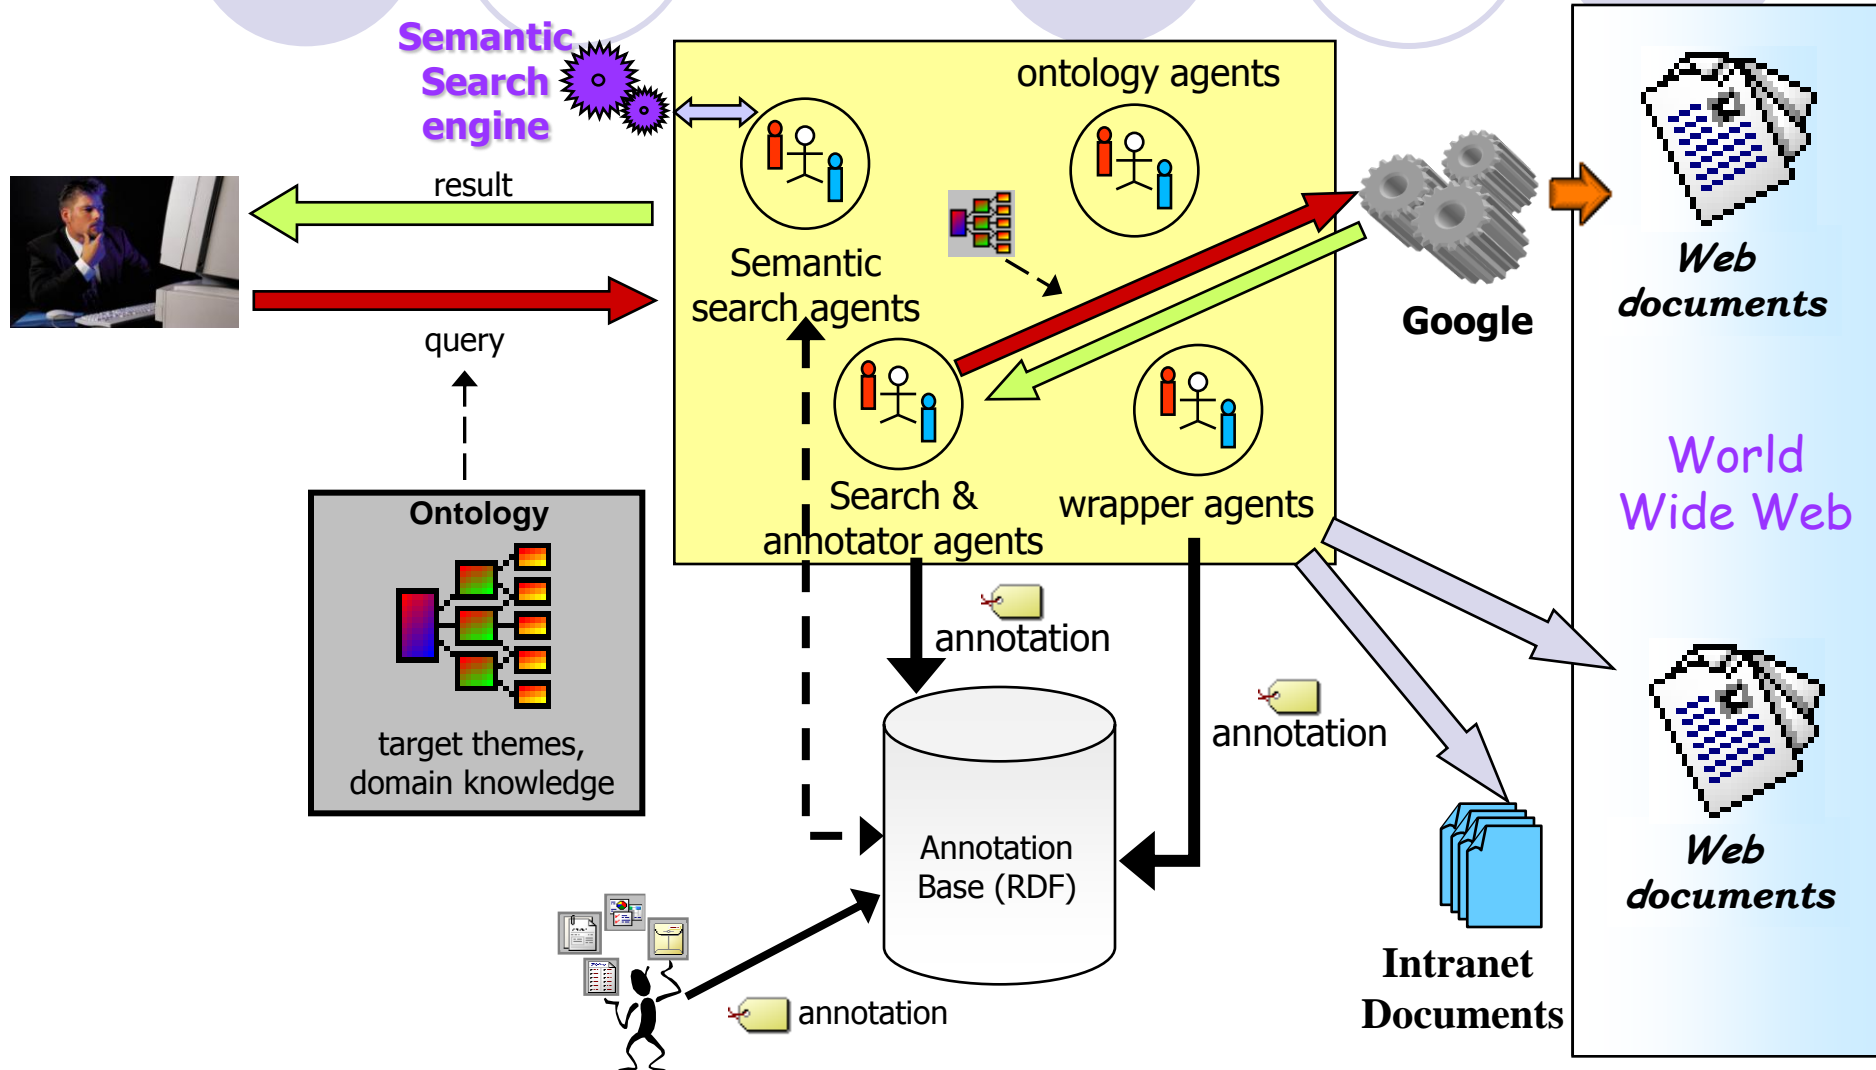

# My case: Exploring SW technologies for technology monitoring

- Technology monitoring consists of monitoring the environment of an organization in order to discover the most recent technological and scientific knowledge, to collect and process all the relevant information, likely to make the organization flourishing at short or long term.
- Web is now considered as a hugest information source, need to be exploited in TM.
  - Information about invention, patent, innovation.
  - Technological trends

# A Technology monitoring process

# Semantic Web approach

# Tools for Semantic Web application development

- Create, edit, manage ontology: Protégé 2000.
- Semantic annotation: Melita, MnM, Annotate, Scream,...
- RDF/S engine: Jena, Corese
- RDF/S semantic search engine: Corese

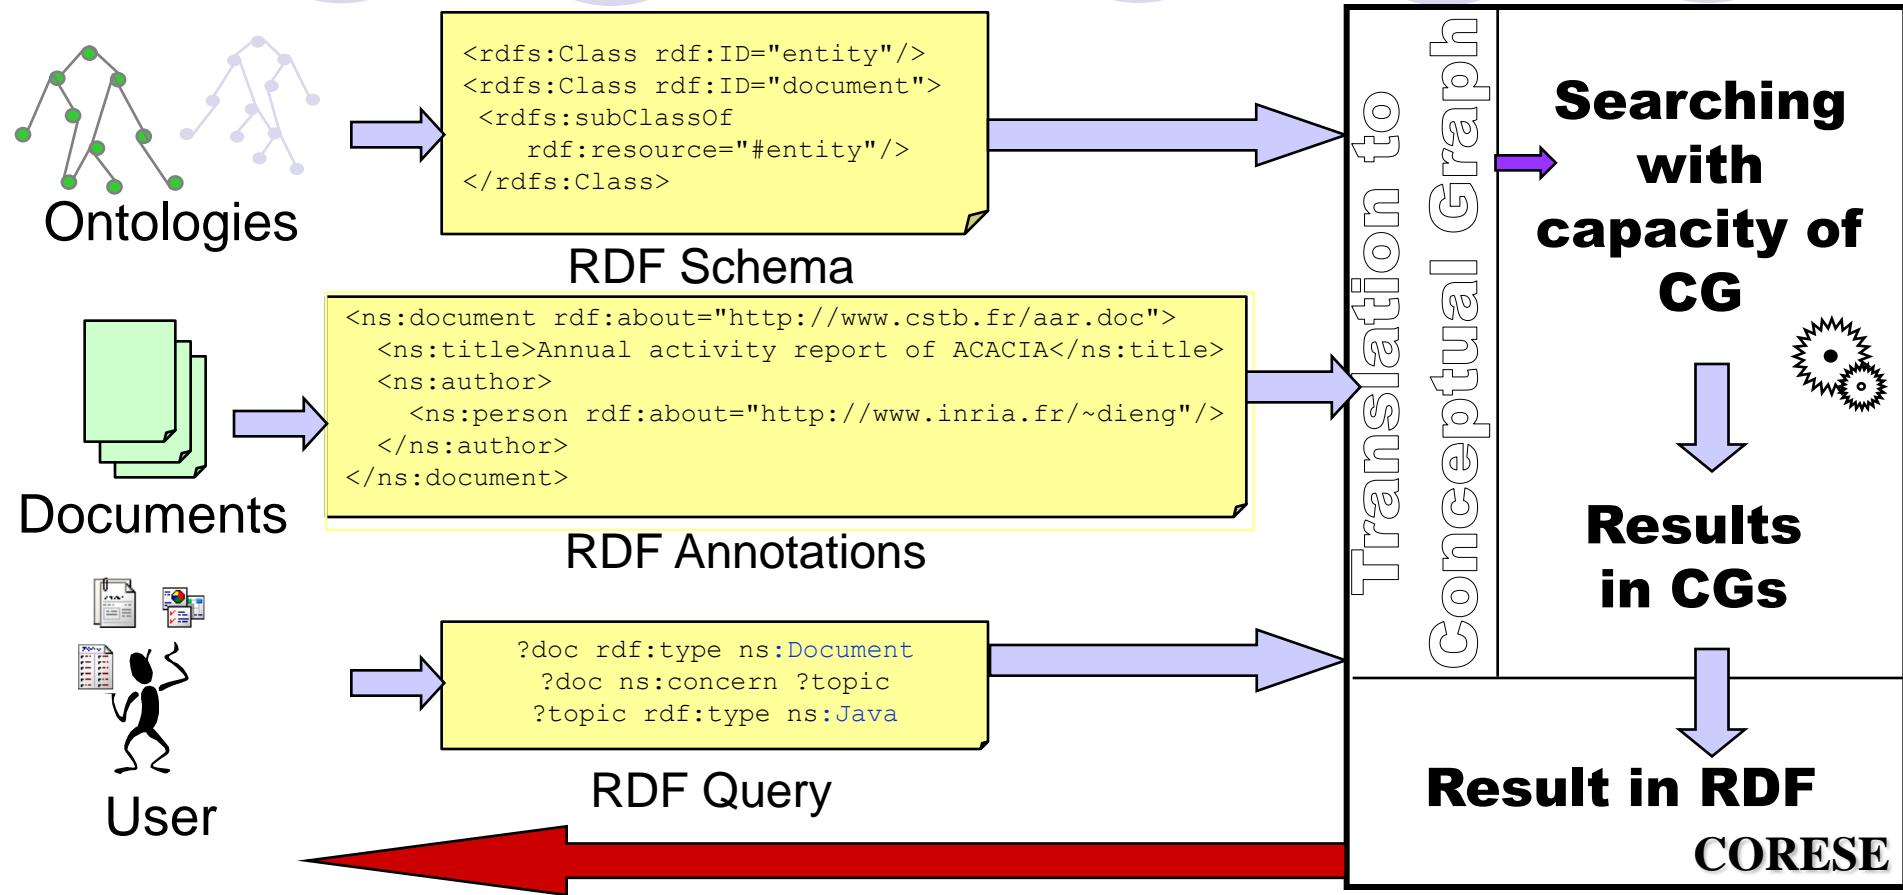

# JENA

- Jena is a Java framework for building Semantic Web applications. It provides a programmatic environment for RDF, RDFS and OWL, including a rule-based inference engine.
- Jena is open source and grown out of work with the HP Labs Semantic Web Program.
- The Jena Framework includes:
  - A RDF API
  - Reading and writing RDF in RDF/XML, N3 and N-Triples
  - An OWL API
  - In-memory and persistent storage
  - RDQL – a query language for RDF

<http://jena.sourceforge.net/>

# Corese - Conceptual Resource Search Engine

# Functionalities

- Manipulate, validate, resolve queries based on ontologies
- Improve the information retrieval with semantic and reasoning, approximate searching
- Semantic Portal & Server
- Dynamic Interfaces
- Integration XHTML + XML + XSLT + RDF

# Query language

SPARQL based query:

**select data where exp**

exp :

resource	property	value
?x	rdf:type	c:Person

resource	operator	value
?name	=	"Olivier"

*«find documents about Java »*

```
?doc rdf:type c:Document
?doc c:concern ?topic
?topic rdf:type c:Java
```

*«find documents about Java  
and return their title and author»*

```
select ?doc ?title ?person where
?doc  rdf:type  c:Document
?doc  c:concern ?topic
?topic rdf:type  c:Java
?doc  c:title   ?title
?doc  c:author  ?person
```

# Inference & Rules

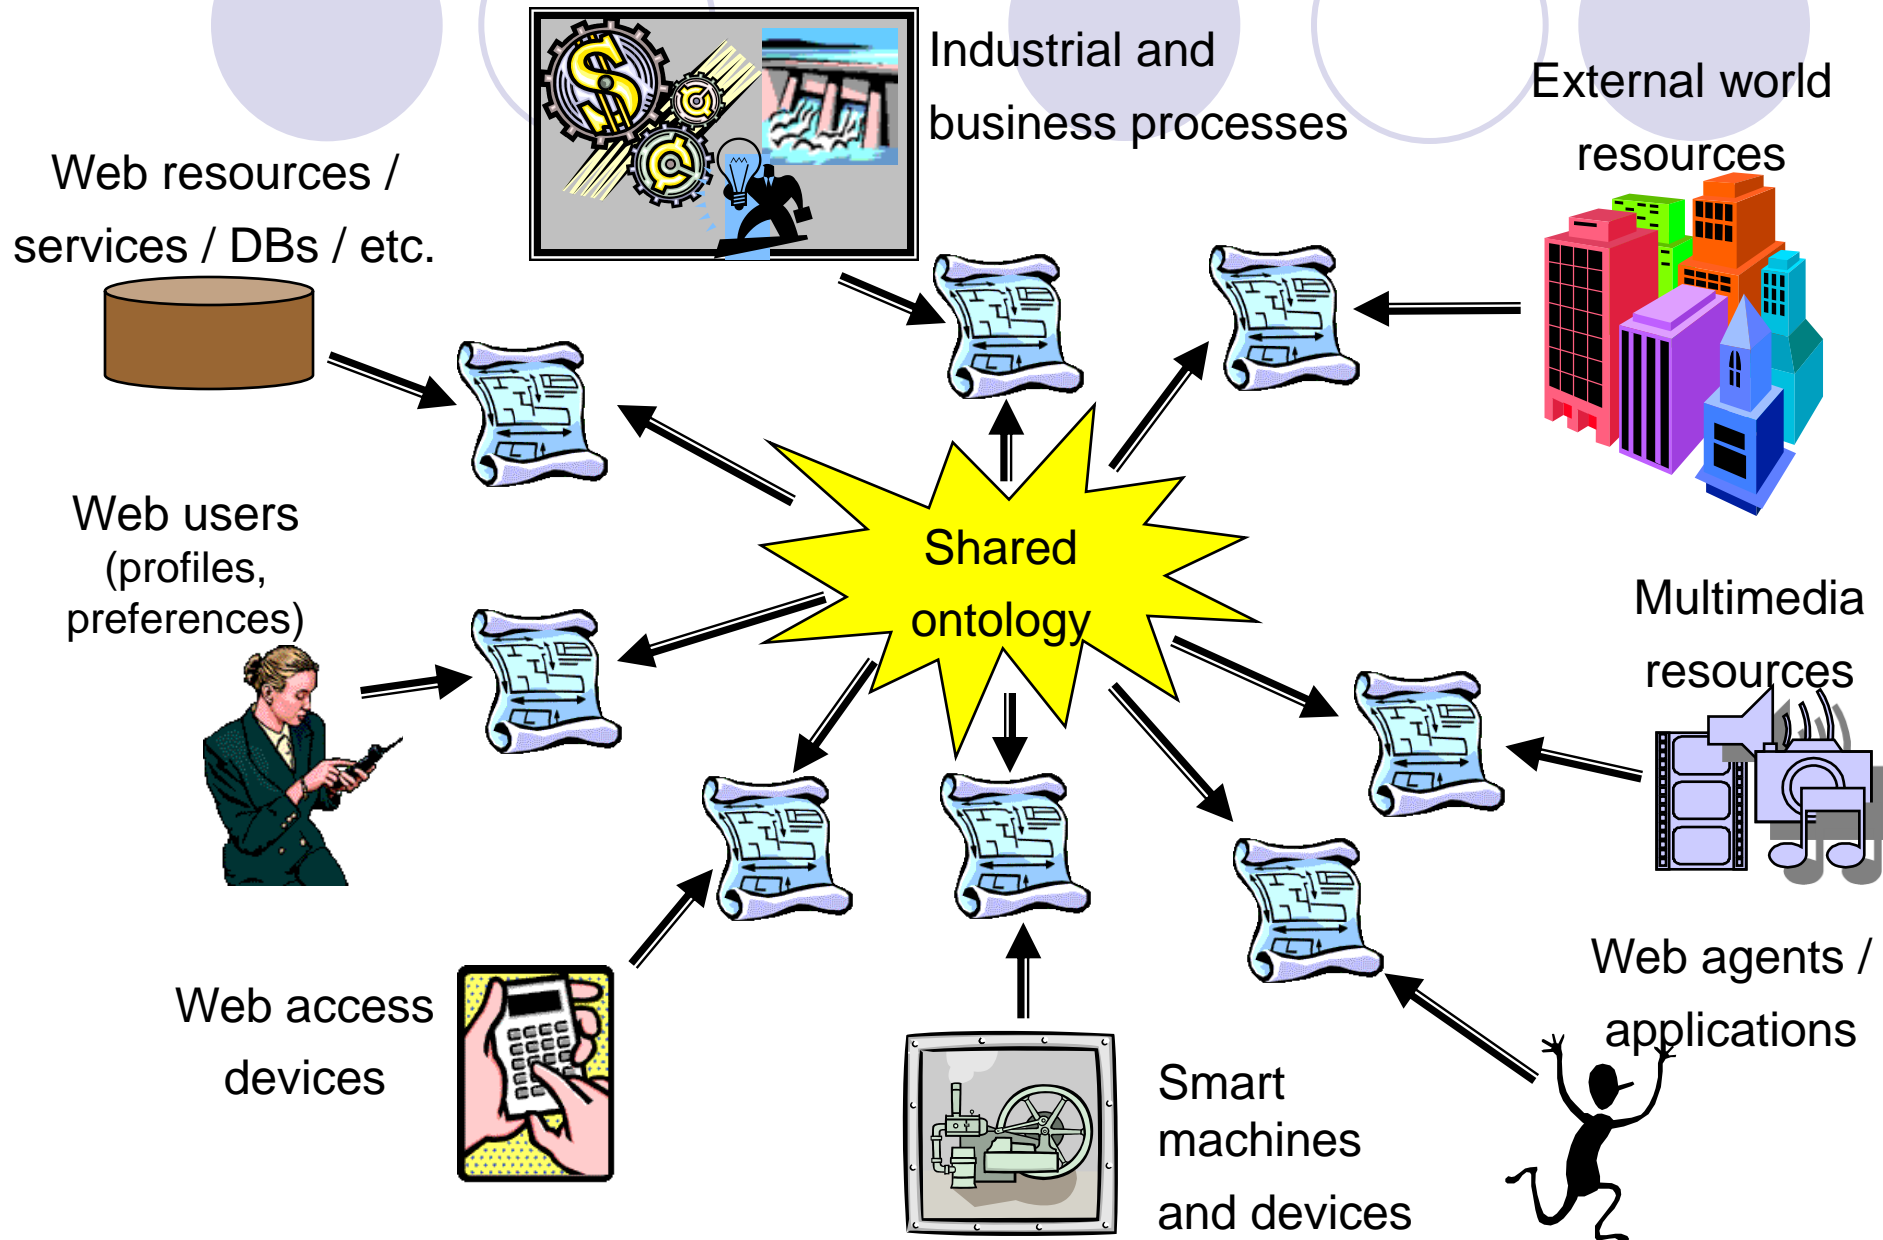

- *If a **person** wrote a **thesis** about a topic then he is a **doctor** and a **expert** of this topic.*
- ?person author ?doc
- ?doc rdf:type PhDThesis
- ?doc concern ?topic
- →
- ?person expertIn ?topic
- ?person rdf:type PhD

Thanks!

# Semantic Web: which resources to annotate ?

World Wide Web

### 3 What was confusing, now makes perfect sense.

Currently, a Web page is developed mainly for human consumption. Software agents that look at the current pages can understand very little. In the future agents will be able to understand the majority of information on the Web.

Semantic Web

### 4 Ontologies give the metadata meaning.

A semantic Web page consists of RDF and linkages to global ontologies. Agents can understand the RDF associated with a page once they have crawled the web of ontologies. It is this set of ontologies or vocabularies that act as a dictionary of sorts to the agents who are attempting to understand the terms used to describe the page. This web of ontologies exists in parallel with the Semantic Web.

### 2 Add metadata. Serve to agents immediately.

By attaching additional data to our existing information, agents are able to recognize and understand what the information is and what it is about. Metadata may be linked to a web page or embedded within the page itself. Where an agent would have previously ignored the information, it can now utilize it to fulfill its task.

### 5 The Semantic Web isn't just about Web sites either!

The Semantic Web aims to make many different types of data usable. Emails, Web sites, calendars, resumes, office documents, and contacts are just some of the information resources that can be utilized by software agents if they are enhanced with metadata. Imagine what new applications are possible once agents can tell the difference between these items!

### 6 How will I use the Semantic Web?

In all likelihood, you'll use the Semantic Web using many different applications. You may have particular applications that use a specific type of information, like calendaring for example. Alternatively, you may choose an application that allows you to control a bevy of agents from within the same user interface. To harness the full potential of the Semantic Web, you'll want to use the different islands of information together to give you new applications and greater insight.

### 1 It's evolution not revolution.

The Semantic Web leverages the content and services that already exist in the World Wide Web. By extending the World Wide Web to be more usable to robots, agents or machines, new applications are now possible.

- The Semantic Web is a layer of machine understandable metadata on top of the World Wide Web
- The World Wide Web is the foundation for the emerging Semantic Web

The Semantic Web  
Illustrated

# 1 It's evolution not revolution

The Semantic Web leverages the content and services that already exist in the World Wide Web. By extending the World Wide Web to be more usable to robots, agents or machines, new applications are now possible.

- The Semantic Web is a layer of machine understandable metadata on top of the World Wide Web
- The World Wide Web is the foundation for the emerging Semantic Web

# 2

## Add metadata.

## Serve to agents immediately

By attaching additional data to our existing information, agents are able to recognize and understand what the information is and what it is about. Metadata may be linked to a web page or embedded within the page itself. Where an agent would have previously ignored the information, it can now utilize it to fulfill its task.

# 3 What was confusing, now makes perfect sense.

World Wide Web

Currently, a Web page is developed mainly for human consumption. Software agents that look at the current pages can understand very little. In the future agents will be able to understand the majority of information on the Web.

Semantic Web

## 4

# Ontologies give the metadata meaning.

A semantic Web page consists of RDF and linkages to global ontologies. Agents can understand the RDF associated with a page once they have crawled the web of ontologies. It is this set of ontologies or vocabularies that act as a dictionary of sorts to the agents who are attempting to understand the terms used to describe the page. This web of ontologies exists in parallel with the Semantic Web.

Ontology

**An email is a message**

**An email has a subject**

... ..

**An email is sent by  
a sender to 1 or more  
reciever**
